

Your Delivery System - Your Responsibilities

During the winter, you will have time to take care of any problems on your irrigation system. Before you shut down, check the following:

- ◆ Valves and pipes for any leaks or problems
- ◆ Nozzles for wear
- ◆ Meters to assure they are working
- ◆ Clean your filter thoroughly
- ◆ Drain your valves, meters and filters

Main canal irrigators—after water shuts down:

- ◆ Check your screen at the main canal. Some have deteriorated and need repair or even reconstruction.
- ◆ The district is cleaning the canal starting this fall. If you “dig out” in front of your screens and delivery when the canal dries out, our equipment can remove the debris when they come through.
- ◆ If you have a delivery from the main canal please check your main delivery line for any problems that need to be repaired.

If you need help with any inspections of your screen or delivery, contact the office and we'll arrange for a ditchrider to meet with you.

SPRING START-UP

After you have left your system open for the winter, you will want to close your drains and valves PRIOR to irrigation system start-up. You will need to replace any meters or valves pulled during the winter and activate your line to check for leaks.
